

Coriolis flow meters on delivery trucks for LNG

Field testing and validation project

Mass flow meters of Coriolis type is a promising technology for quantity measurement and sales of LNG. In many cases the LNG is distributed by truck and sold by mass, volume or energy units on site. There are of course many aspects when using precision instruments on a truck; harsh environment and need for simple and fast operation. Still the results must be reliable! To ensure this it is needed to know all aspects of the measurement process. Therefore Gustaf Fagerberg AB, the KROHNE sales representative in Sweden, has started a validation project together with customers, manufacturers and calibration institutes.

Project start delayed – results will be presented later.
